

Two controls: class imbalance and client concentration

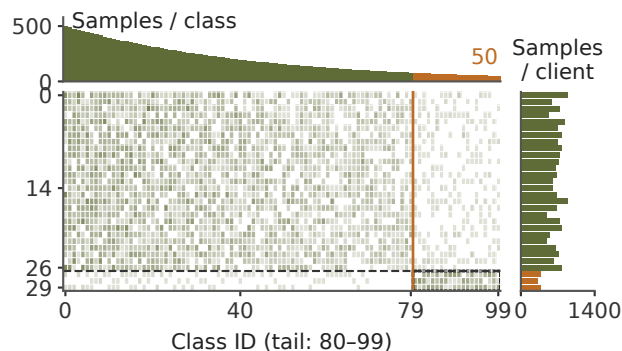

Across: λ_T increases | Down: IF increases | $\alpha_T=0.5$, $q_T=0.1$, $\rho=3$

Partition construction only; these four panels are not training results.

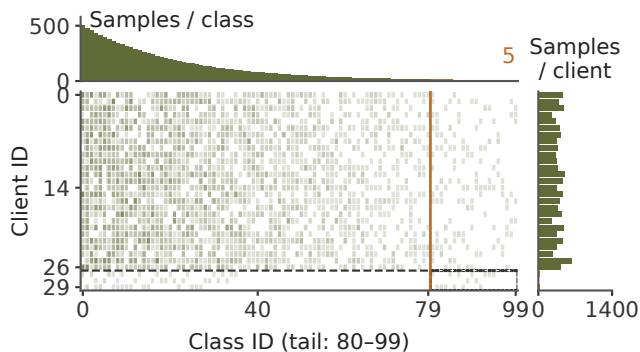

IF = 10, $\lambda_T=0$
Tail in clients 27-29: 10.0%

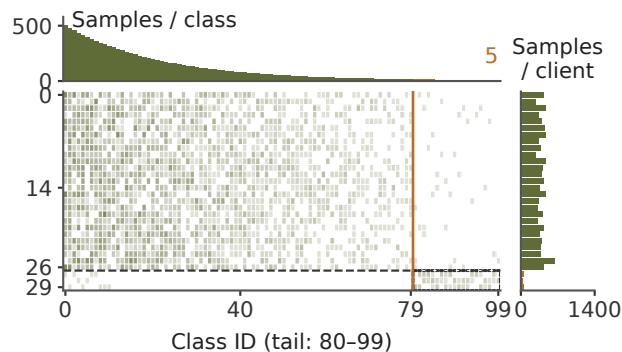

IF = 10, $\lambda_T=0.75$
Tail in clients 27-29: 77.5%

IF = 100, $\lambda_T=0$
Tail in clients 27-29: 9.8%

IF = 100, $\lambda_T=0.75$
Tail in clients 27-29: 77.8%

$\lambda_T=0$ is still Client-LT; it is not class-wise Dirichlet.
